

Leading the way in industrial symbiosis

As experienced facilitators, we find ways of using by-products from one partner as raw material for another. At Solvakem, we see industrial symbiosis as an innovative, mutually beneficial solution to many of the environmental and economic challenges facing industries today.

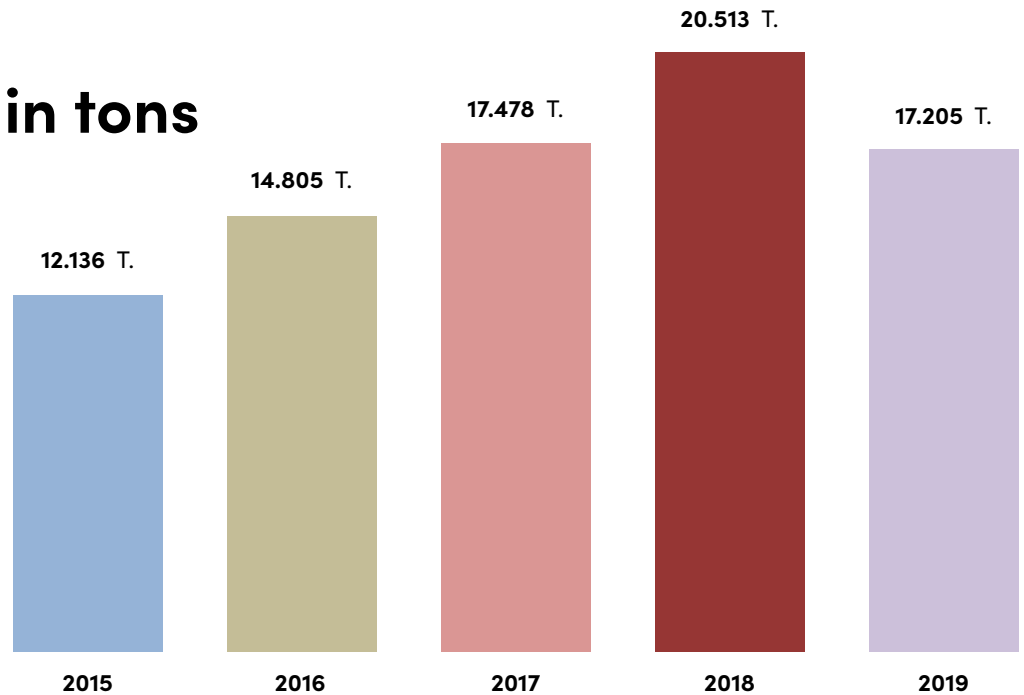

For the last 25 years, Solvakem has added value to approximately 15.000 tons of chemical by-products per year. That's 15.000 tons of materials annually that aren't incinerated or dumped in landfill. Our aim is always to favour 'higher' forms of waste management on Lansink's Ladder so we can ensure that fewer limited resources are used and that the carbon footprint is reduced considerably.

We offer:

- 50 years of experience in the field
- A highly developed network across European countries and industries
- A creative and agile team within a family-run SME
- Tailor-made solutions for our industrial clients

By-Products valorization in tons
